What is Model Context Protocol Server

- Model Context Protocol Server, is a standardized service that exposes tools, data sources, and actions to AI agents through a consistent, structured interface.
- It acts as the controlled boundary between an AI model and enterprise systems, enforcing permissions, governance, and auditability when the model reads data or performs operations.
- In practice, an MCP server lets agents safely query APIs, repositories, tickets, logs, or run approved actions without embedding direct system access inside the model itself.

Client - LLM - Server

(Elicitation) Client - Server

(Sampling) Client - Server

(Resources / Prompts) Client - Server - LLM

Thanks!
